DESCRIPTION OF THE PROGRAM INTERFACE

INTRODUCTION

The fiscal device operates under the control of an application program, with which communicates via RS232 serial connection. The device executes a previously set of wrapped commands, arranged according to the type of the operations which have to be executed. The application program does not have a direct access to the resources of the fiscal device although it can detect data connected with the status of the fiscal device and the fiscal control unit.

LOW LEVEL PROTOCOL

A) PROTOCOL TYPE - MASTER (HOST) / SLAVE

The cash register performs the commands sent by the Host and returns messages, which depend on the result.

The cash register cannot instigate asynchronous communications itself. Only responses to commands from the Host are sent to the Host. These messages are either wrapped or single byte control codes. The cash register maintains the communication via the RS232 serial connection at baud rates of 1200, 2400, 4800, 9600, 19200, 38400, 57600 and 115200 b/s, 8N1.

B) SEQUENCE OF THE MESSAGES

Host sends a wrapped message, containing a command for the cash register.

ECR executes the requested operation and response with a wrapped message.

Host has to wait for a response from the cash register before to send another message.

The protocol uses non-wrapped messages with a length one byte for processing of the necessary pauses and error conditions.

C) NON-WRAPPED MESSAGES - TIME-OUT

When the transmitting of messages from the Host is normal, Slave answers not later than 60 ms either with a wrapped message or with a 1 byte code. Host must have 500 ms of time-out for receiving a message from Slave. If there is no message during this period of time the Host will transmit the message again with the same sequence number and the same command. After several unsuccessful attempts Host must indicate that there is either no connection to the cash register or there is a hardware fault.

Non-wrapped messages consist of one byte and they are:

A) NAK 15H

This code is sent by Slave when an error in the control sum or the form of the received message is found. When Host receives a NAK it must again send a message with the same sequence number.

B) SYN 16H

This code is sent by Slave upon receiving a command which needs longer processing time. SYN is sent every 60 ms until the wrapped message is not ready for transmitting.

D) WRAPPED MESSAGES

a) Host to cash register (Send)

<01><LEN><SEQ><CMD><DATA><05><BCC><03>

b) Cash register to Host (Receive)

<01><LEN><SEQ><CMD><DATA><04><STATUS><05><BCC><03>

Where:

- <01> Preamble.
1 byte long. Value: 01H.
- <LEN> Number of bytes from <01> preamble (excluded) to <05> (included) plus the fixed offset of 20H.
Length: 4 bytes.
Each digit from the two bytes is sent after 30H is added to it. For example the sum 1AE3H is presented as 31H, 3AH, 3EH, 33H.
- <SEQ> Sequence number of the frame.
Length : 1 byte. Value: 20H – FFH.
The cash register saves the same <SEQ> in the return message. If the ECR gets a message with the same <SEQ> as the last message received it will not perform any operation, but will repeat the last sent message.
- <CMD> The code of the command.
Length: 4 byte.
The cash register saves the same <CMD> in the return message. If the cash register receives a non-existing code it returns a wrapped message with zero length in the data field and sets the respective status bit.
Each digit from the two bytes is sent after 30H is added to it. For example the sum 1AE3H is presented as 31H, 3AH, 3EH, 33H.
- <DATA> Data.
Length: 0-213bytes for Host to cash register, 0-218 bytes for Cash register to Host.
Value: 20H – FFH ; .
The format and length of the field for storing data depends on the command. If the command has no data the length of this field is zero. If there is a syntax error the respective status bit is established in the data and a wrapped message is returned with zero field length.
- <04> Separator (only for cash register-to-Host messages)
Length: 1 byte. Value: 04H.
- <STATUS> The field with the current status of the fiscal device.
Length: 8 bytes. Value: 80H-FFH.
- <05> Postamble
Length: 1 byte. Value: 05H.
- <BCC> Control sum (0000H-FFFFH)
Length: 4 bytes. Value of each byte: 30H-3FH.
The sum includes between <01> preamble (excluded) to <05>. Each digit from the two bytes is sent after 30H is added to it. For example the sum 1AE3H is presented as 31H, 3AH, 3EH, 33H.
- <03> Terminator
Length: 1 byte. Value: 03H.

MESSAGE COMPOSITION, SYNTAX, AND MEANINGS

- The data field depends on the command.
- The parameters sent to the cash register may be separated with a [\t] and/or may have a fixed length.
- The separator([\t]) between the parameters shows that it is mandatory.

d) Some of the parameters are mandatory and others are optional. Optional parameters can be left empty, but after them must have separator ([\t]).

The symbols with ASCII codes under 32 (20H) have special meanings and their use is explained whenever necessary. If such a symbol has to be sent for some reason (for example in an ESCAPE-command to the display) it must be preceded by 16 (10H) with an added offset 40H.
